Fushan Forest Dynamics Plot (FFDP)

- 121° 33' E, 24° 45' N
- 600-733 m above sea level
- 500 m x 500 m (25 ha)

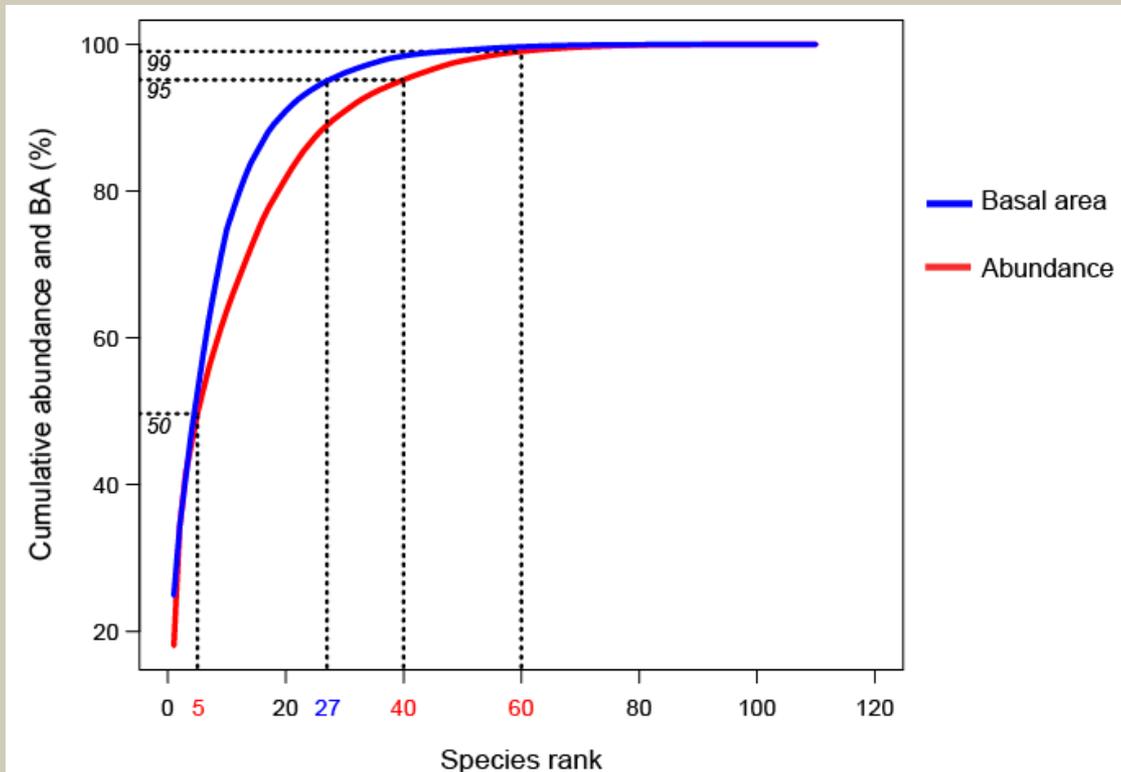

Climate

- Warm and humid
- Typhoon disturbances (June to Sep.)
- Monsoon effects in summer and winter

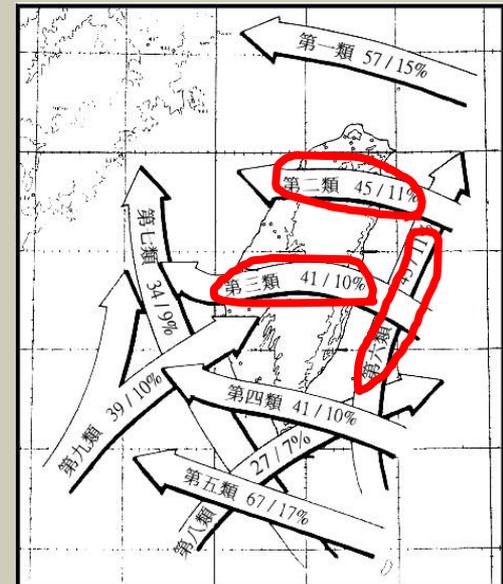

Forest Composition

- 114,354 individuals (4574 trees/ha)
- 110 species
- Strong dominance concentration

Tree Census

- First census in 2003-2004
- Second census in 2008-2009
- Typhoon events
 - 1 event during the first census
 - 10 events during inter-census period
 - 4 events during the second census

Main Questions

- What is the feature of community dynamics at this typhoon-disturbed forest? Is it rapid or unstable?
- How is the differentiation of life history characteristics of tree species?

Five-year Demography

- 4 species of single individual emigrated
- Whole community increased 2,894 individuals (15,869 recruits - 12,975 deaths)
- Total basal area increased 2.04 m²ha⁻¹
- Demographic rates
 - Mortality = 2.61 %yr⁻¹
 - Recruitment = 3.05 %yr⁻¹
 - RGR = 2.78 %yr⁻¹

$$\begin{aligned} & \text{mortality rate} \\ &= \frac{\ln(N_0) - \ln(\text{survivors})}{\text{time}} \end{aligned}$$

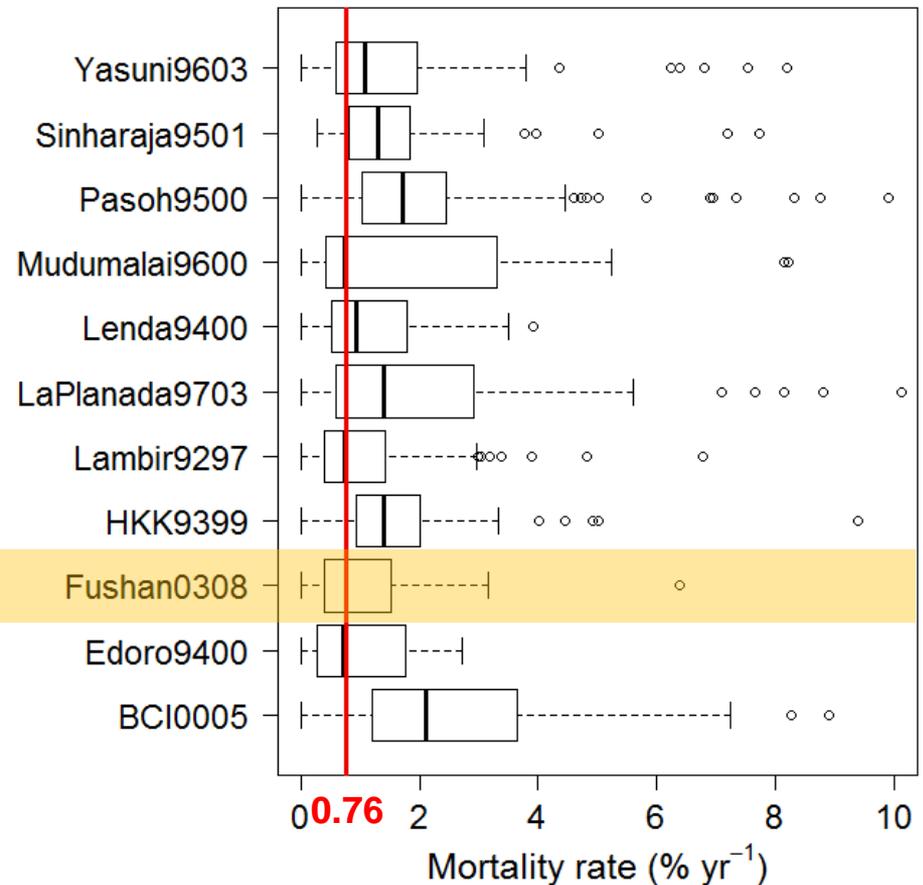

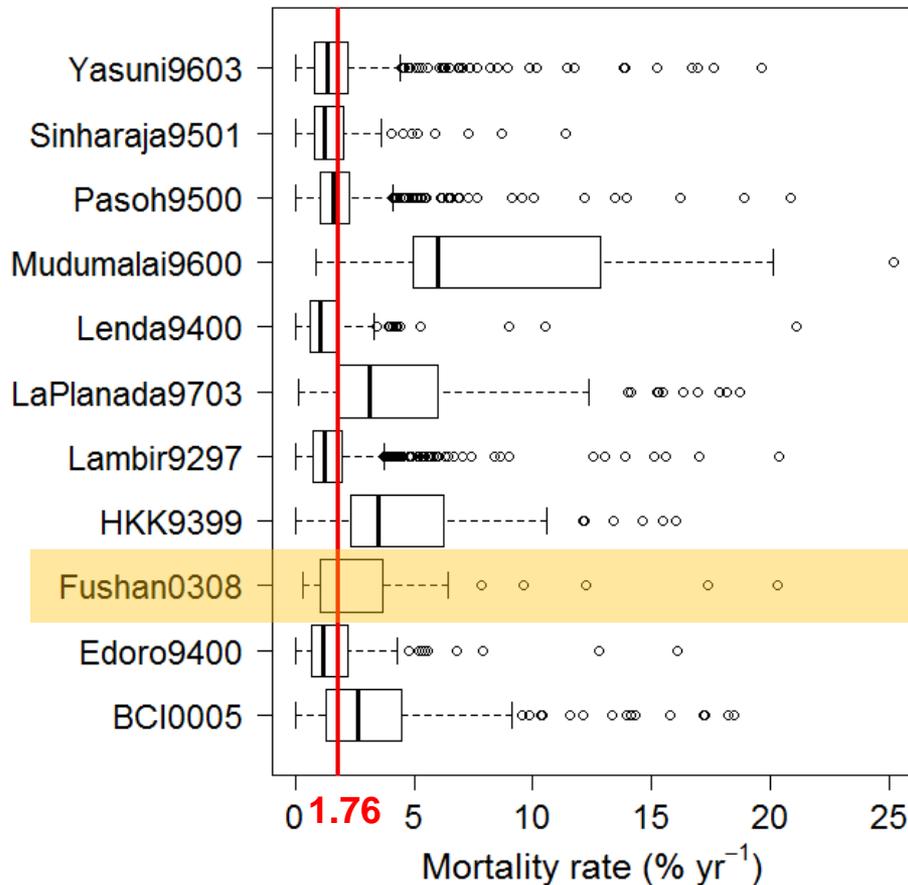

$$\begin{aligned} & \text{recruitment rate} \\ &= \frac{\ln(N_1) - \ln(\text{survivors})}{\text{time}} \end{aligned}$$

$$\begin{aligned} & \text{relative growth rate (RGR)} \\ &= \frac{\ln(\text{DBH}_1) - \ln(\text{DBH}_0)}{\text{time}} \end{aligned}$$

Comparison with Tropical FDPs (Mortality Rate)

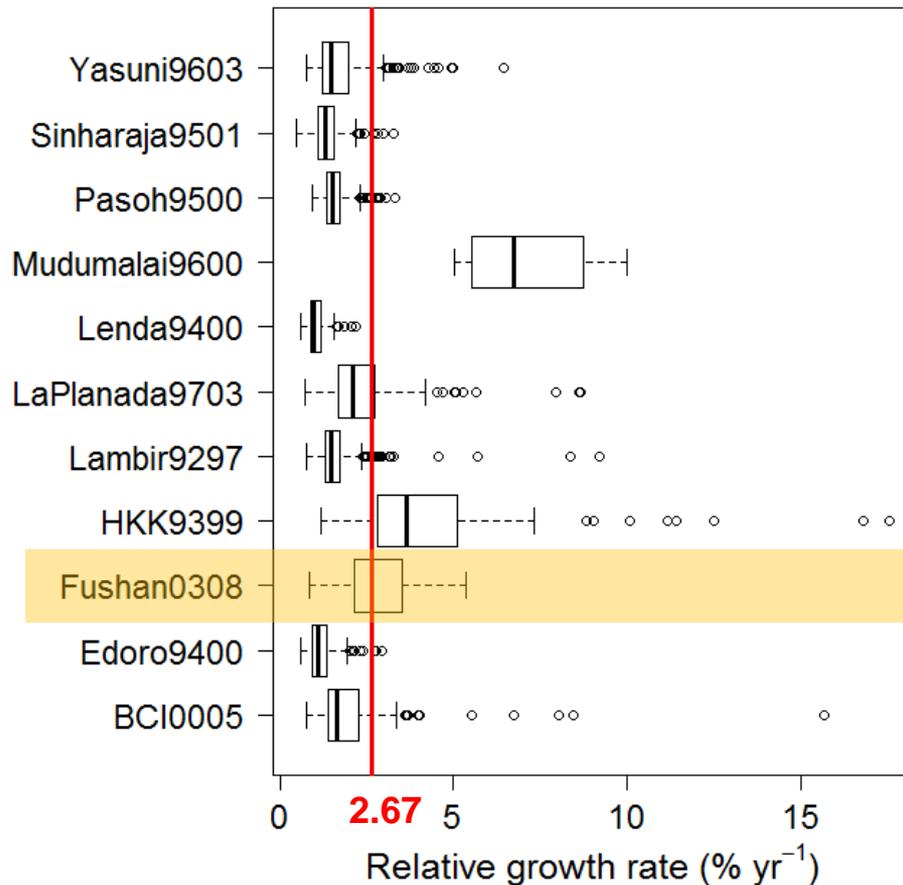

**1-10 cm diameter
(5th highest / 11)**

**≥ 10 cm diameter
(8th / 11)**

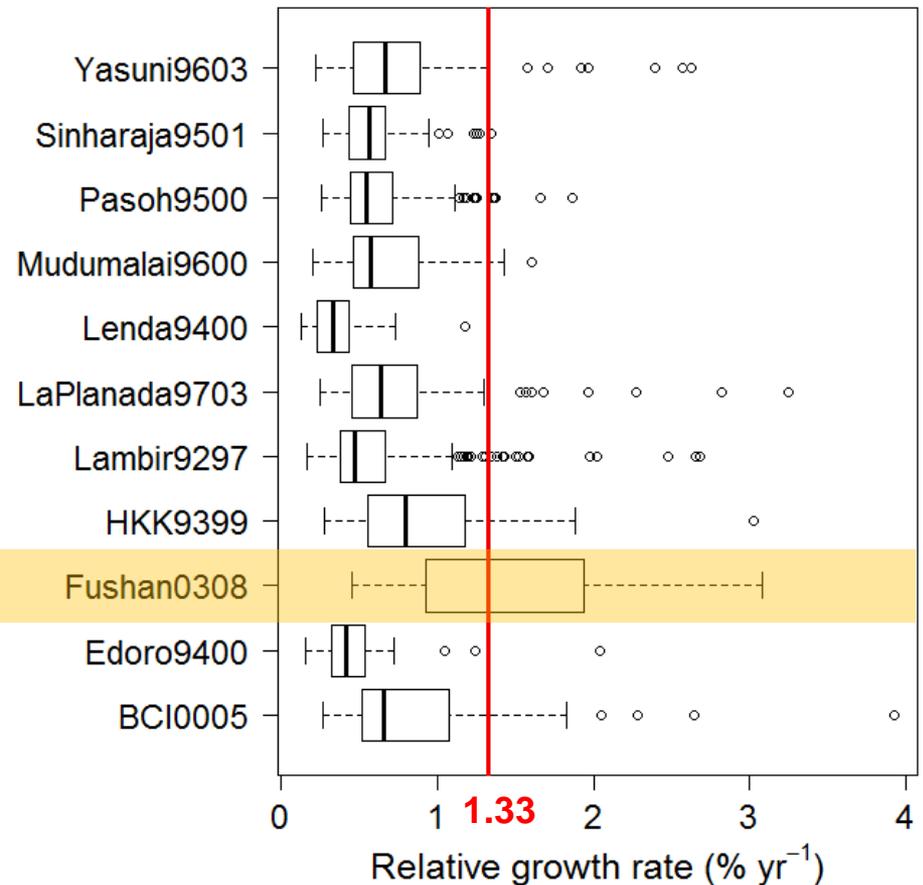

Comparison with Tropical FDPs (Relative Growth Rate)

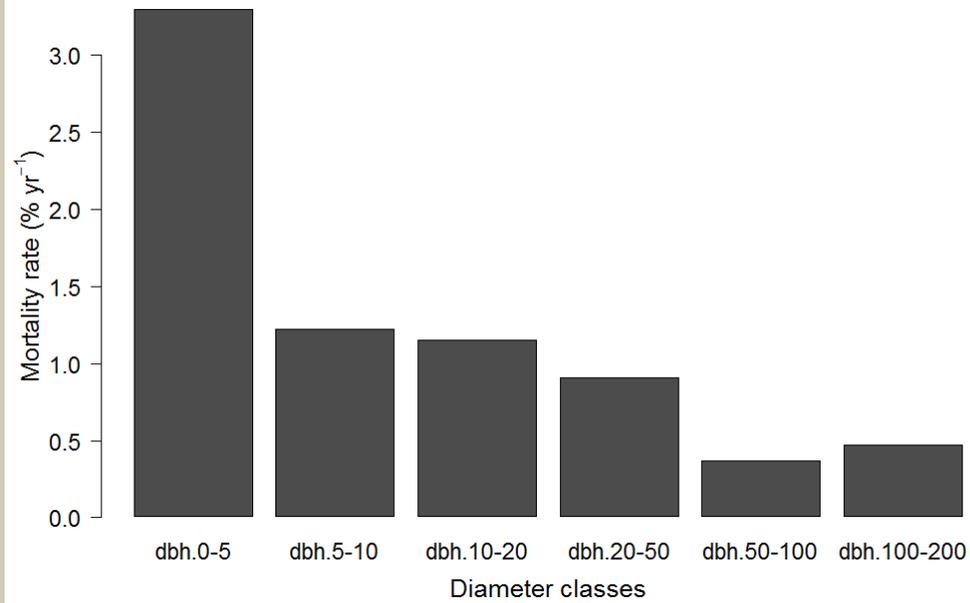

**1-10 cm diameter
(3rd highest / 11)**

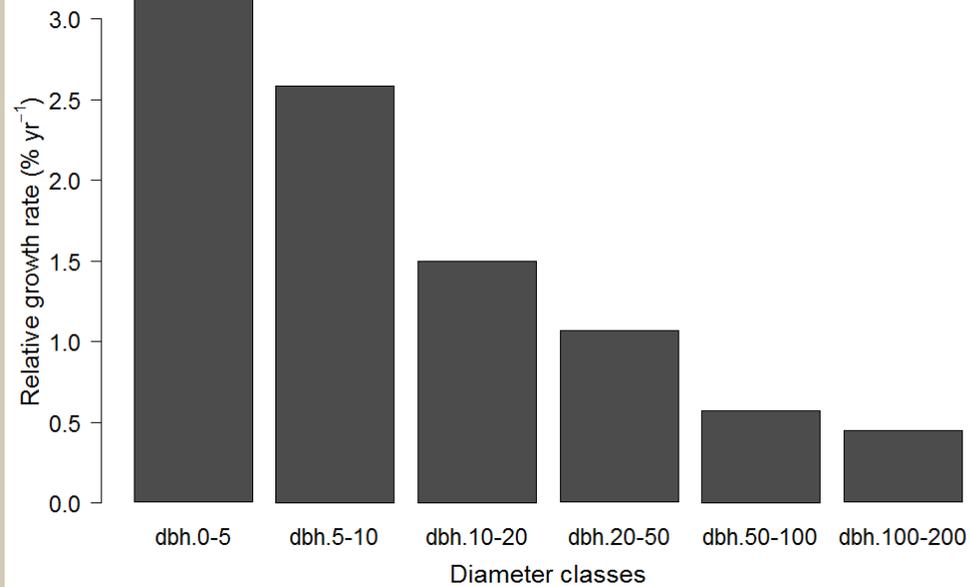

**≥ 10 cm diameter
(1st / 11)**

Mortality rate

Relative growth rate

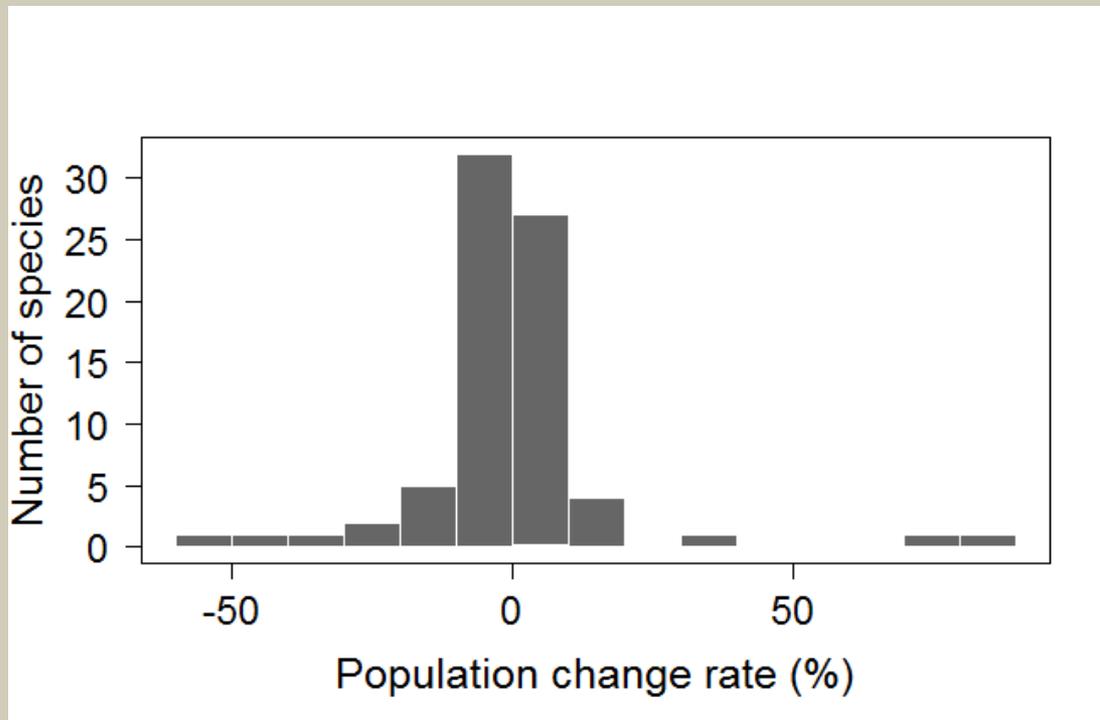

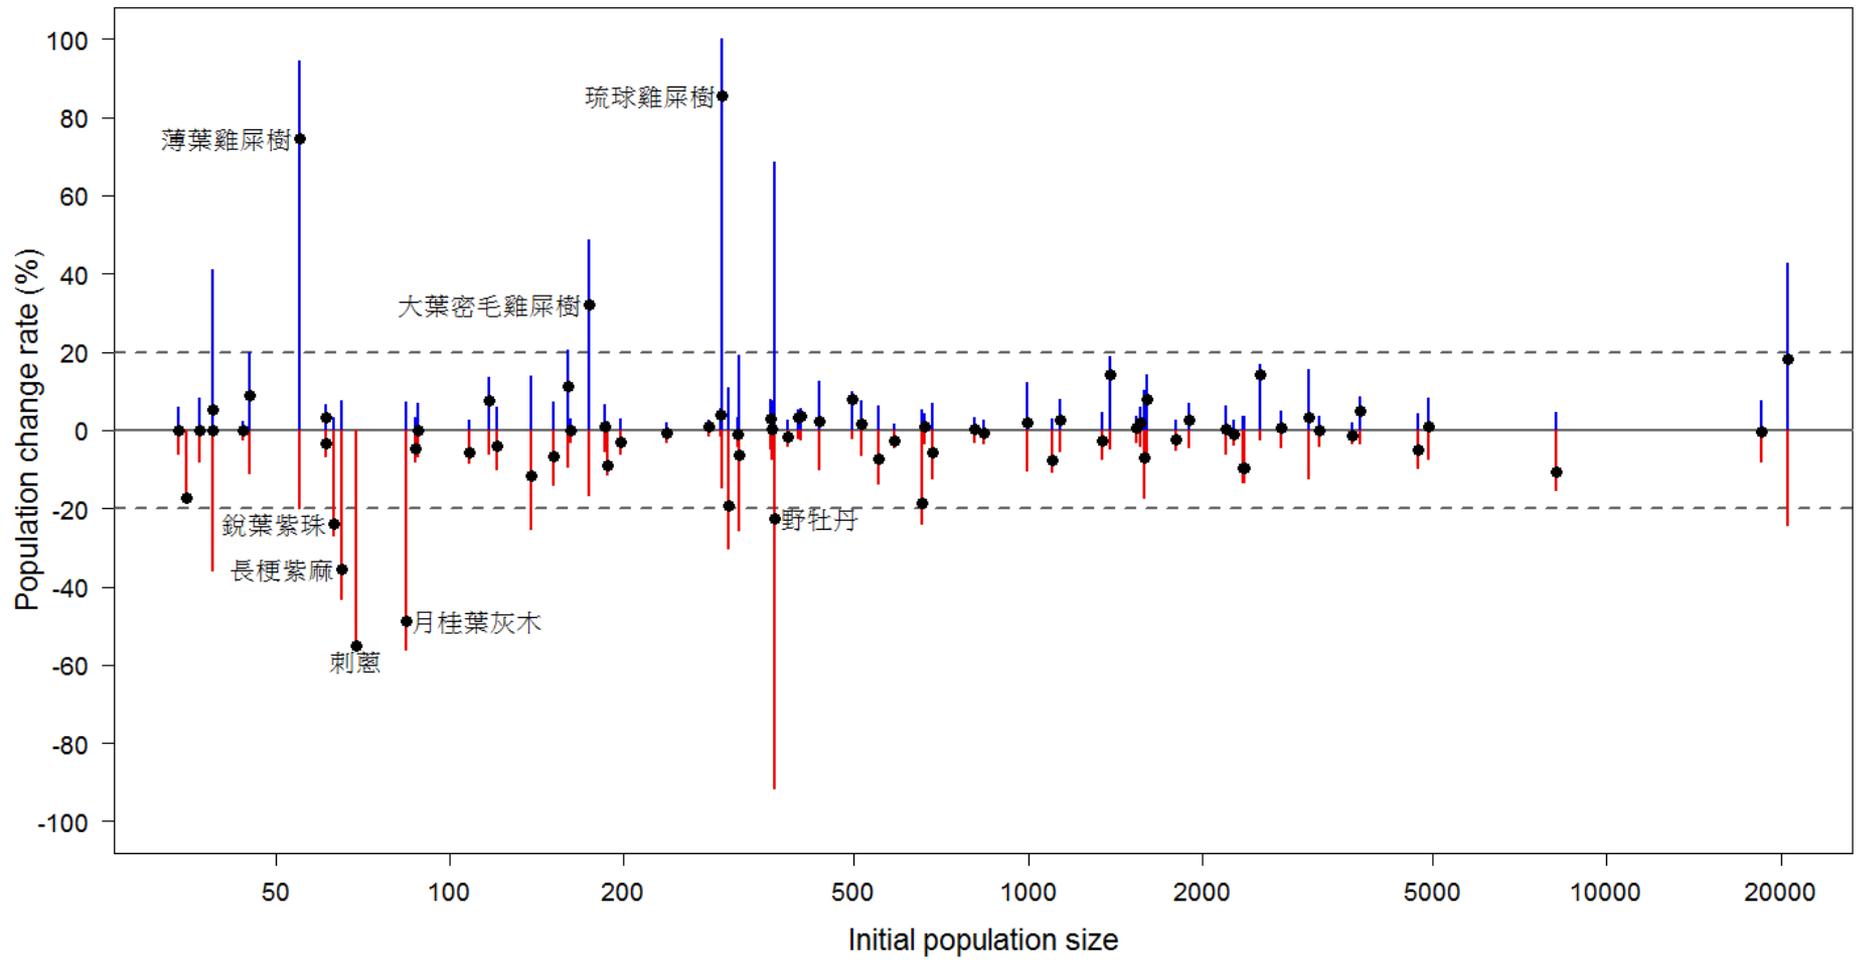

Population Changes in FFDP

34 spp. increased

36 spp. decreased

6 spp. remained the same

Species Life History Characteristics

- **Principal component analysis (PCA)**
 - **Demographic variables + population structural variables**
 - **Mortality and recruitment rates**
 - **Relative growth rate(**
 - **Coefficient of variation of relative growth rate**
 - **Abundance, basal area**

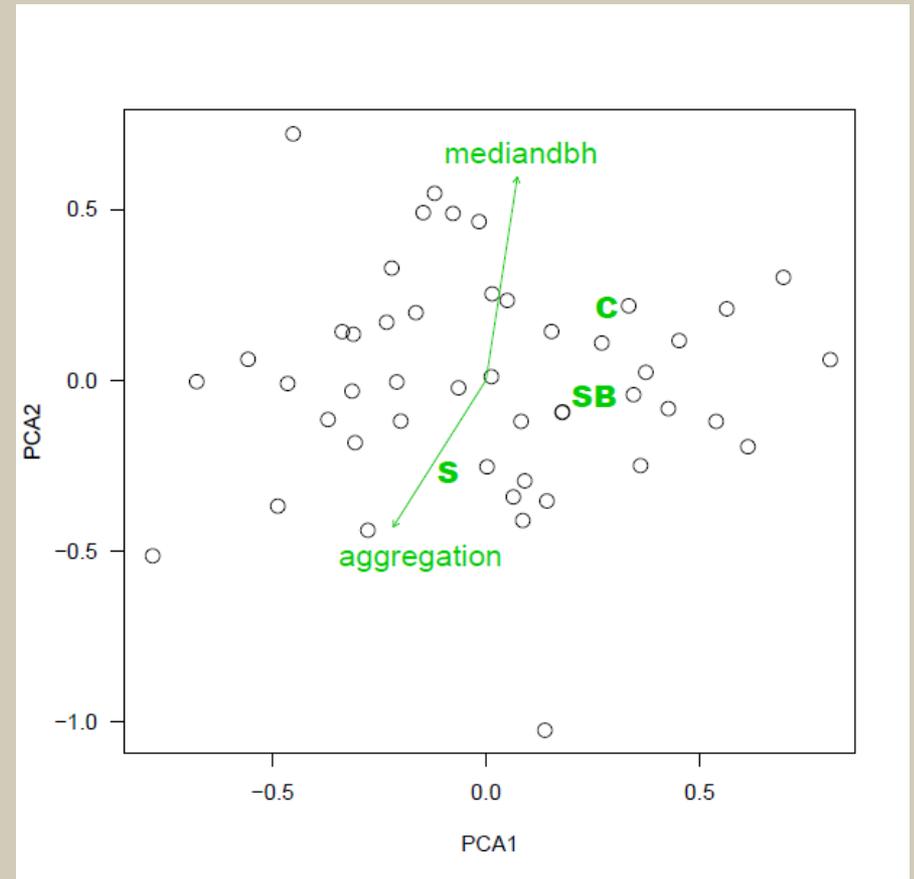

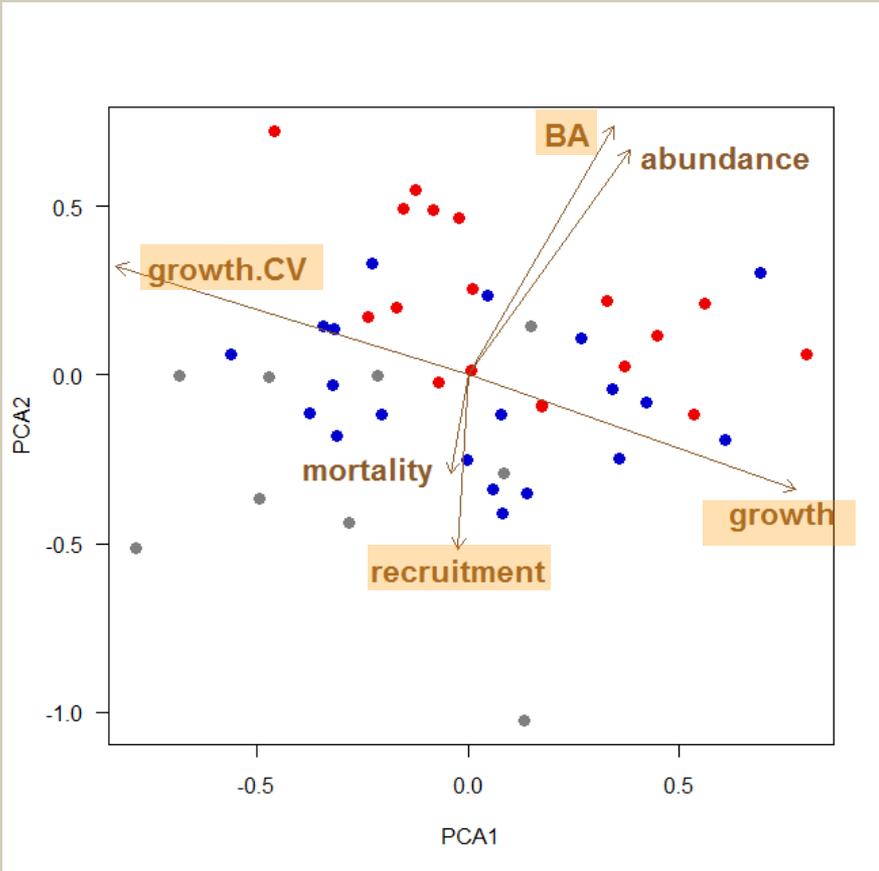

- **Correlation of species traits and species performance**
- **Trait variables**
 - **Lifeform: canopy trees, sub-canopy trees, shrubs**
 - **Size: median of diameter**
 - **Multi-stem status**
 - **Proportion of multi-stemmed individuals**
 - **Mean stem number by individual**
 - **Aggregation: Ripley's K statistic (within 10-m-radius area)**
 - **Wood specific gravity**

■ PCA results

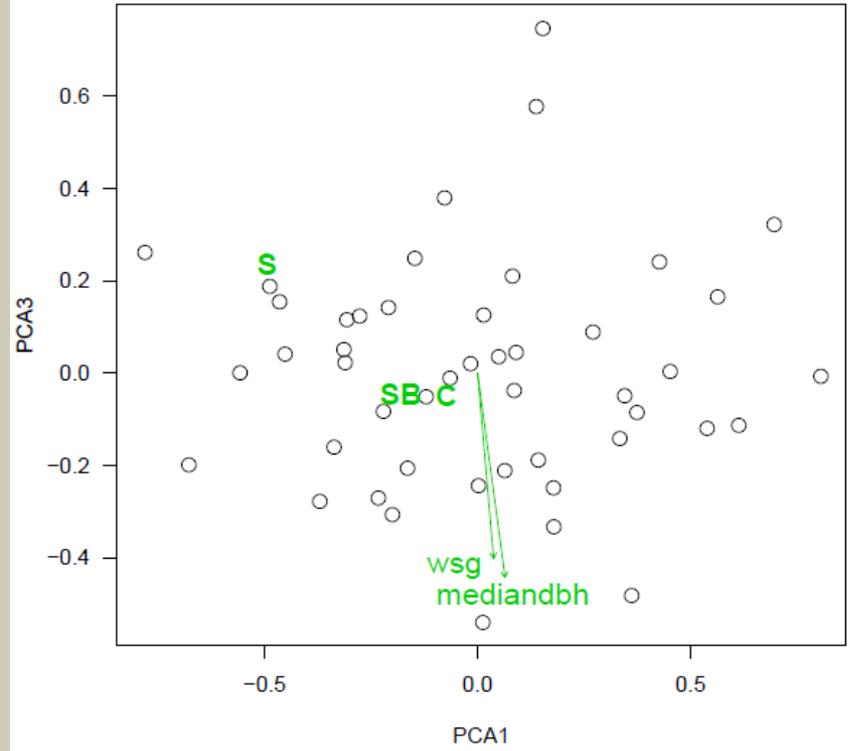

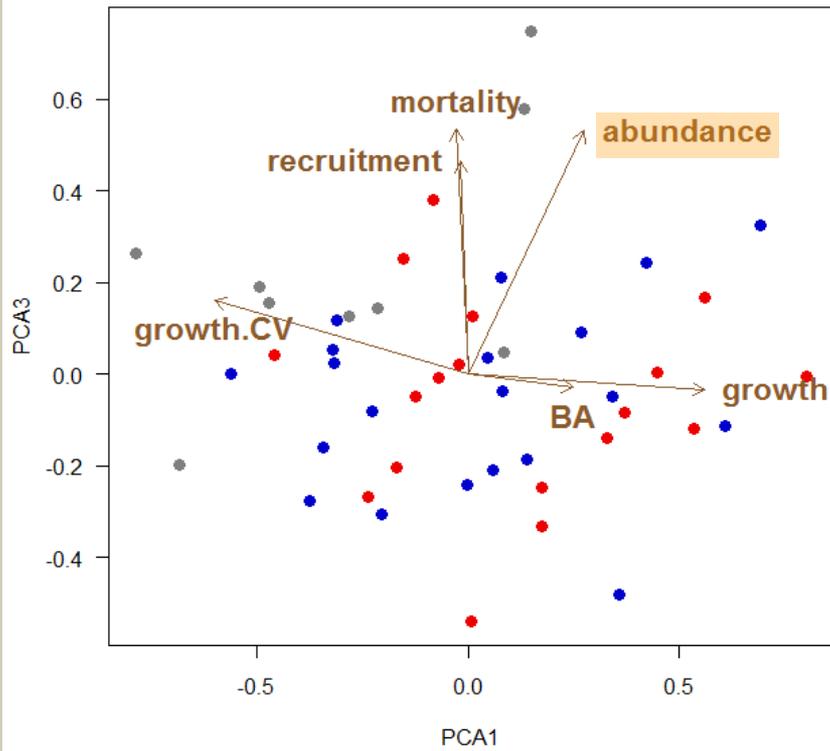

PCA axis	% variance	Cumulative % variance
1	41.4	41.4
2	30.4	71.8
3	18.8	90.6

Variables	PCA loadings		
	Axis 1	Axis 2	Axis 3
abundance	0.31	<u>0.53</u>	<u>0.59</u>
BA	0.28	<u>0.59</u>	-0.03
mortality	-0.03	-0.23	<u>0.59</u>
growth	<u>0.62</u>	-0.27	-0.04
growth.CV	<u>-0.67</u>	0.26	0.18
recruitment	-0.02	<u>-0.41</u>	<u>0.52</u>

■ PCA1 vs. PCA2

■ PCA1 vs. PCA3

Summary

- **Demography of species in FFDP**
 - Higher growth efficiency than most tropical FDPs
 - Lower mortality than the expected
 - Small sapling phase (0-5 cm diameter) showed greatest dynamics
 - No obvious directional change on forest composition
- **Adaption to typhoon disturbance (persistence)**

- **Life history differentiation of tree species**
 - Species showed the greatest variation on RGR-related variables
 - Species dominance (BA) is negatively correlated to recruitment
 - Mortality is positively correlated to recruitment ("demographic niche")
 - RGR-related variables were not related to mortality and recruitment
 - Size and wood specific gravity traits were negatively related to species demography

Acknowledgement

- Field crews of the two tree census work
- Forest Bureau, Council of Agriculture, National Science Council for generous funding
- Fushan Research Center and Taiwan Academy of Ecology for logistic support
- Drs. W. L. Chiou, I. F. Sun, and H. B. King for the motivation of FFDP project
